

# Agenda Item #11

## Discussion on the Use of Magnification/ Verifier Devices on Archery Equipment

Field Operations Division

# Current Rule

- 19.31.10.7.E. “Bow” shall mean compound, recurve, or long bow. Sights on bows shall not project light nor magnify.
- Some hunters who have difficulty focusing on their sight pins have expressed a desire to use a “Verifier” on their bow sights.

# Magnification/ Verifier Devices

- Used when shooting with pins to provide a clearer view of the pins
- The Verifier has one lens installed in the peep which is similar to reading glasses. This allows the shooter to see the sight pins more clearly. It does not magnify the target but does slightly magnify the pins.

Field Operations Division

# VS. Clarifiers

- A clarifier is used when you shoot with a scope with a lens to clear up the target
- A clarifier is a lens installed in the peep that will allow you to see the target more clearly when used with another lens in your scope or sight. Clarifiers are only used if you shoot with a scope (or pin sight) with a lens. Clarifiers are meant for the 2 lenses to work together to provide a clearer target image.

# What Verifiers Do

No Verifier, Or Verifier  
Too Weak - Fuzzy Pins

Verifier Power Correct  
Clear Target / Clear Pins

Verifier Power Too Strong  
Fuzzy Target

Field Operations Division

# Scopes

- We can change the definition of “bows” in rule to allow for the legal use of verifiers, clarifiers and scopes.
- **19.31.10.7.E. “Bow”** shall mean compound, recurve, or long bow. Sights on bows shall not project light. ~~nor magnify.~~
- The use of crossbows during an archery hunt would still be limited to those who are registered with the Department as “Mobility Impaired” (MI).
